                                                                                                                                                                                                                                                                                                                                  1593
                                                                                                                                                                                                                                                                                                                                                                                                                      1473
                                                                                                                                                                                                                                                                                                                                                                                                                                                               1413
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to a method for diagnosing a disorder characterised by expression of a human cancer associated antigen precursor coded for by a nucleic acid molecule (NAM). The method comprises: (a) contacting a biological sample isolated from a subject with an agent that specifically binds to the NAM, an expression product or a fragment of an expression product complexed with an HLA molecule; and (b) determining the interaction between the agent and the NAM or the expression product as a determination of the disorder. The products and methods can be used in the diagnosis, monitoring, research, or treatment of conditions characterised by the expression of various cancer associated antigens. The invention provides nucleic acid sequences and encoded polypeptides which are cancer associated antigen precursors expressed in human breast cancer, renal cancer, colon cancer, gastric cancer, prostate cancer and
                                                                                                                                                                                                                                                                                                                                                                            1533

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Qγ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         γ
The invention relates to a method for diagnosing a disorder characterised by expression of a human cancer associated antigen precursor coded for by a nucleic acid molecule (NAM). The method comprises: (a) contacting a biological sample isolated from a subject with an agent that specifically binds to the NAM, an expression product or a fragment of an expression product complexed with an HLA molecule; and (b) determining the interaction between the agent and the NAM or the expression product as a determination of the disorder. The products and methods can be used in the diagnosis, monitoring, research, or treatment of conditions characterised by the expression of various cancer associated antigens. The invention provides nucleic acid sequences and encoded polypeptides which are cancer associated antigen precursors expressed in human breast
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         10-OCT-1997;

The polynucleotide, which is a secreted EST, and the encoded protein are predicted to have useful biological activities which would make them suitable for treating, preventing or ameliorating medical conditions in humans and animals, although no supporting data is given. Suggested activities include nutritional activity, immune stimulating or suppressing activity, haematopolesis regulating activity, tissue growth activity, activin/inhibin activity, chemotactic/chemokinetic activity, activin/inhibin activity, cadherin/tumour invasion suppressor activity, tumour inhibition activity. The polynucleotide may also be useful for gene therapy.
                                                                                                                                                                                                                                                                                                                                                2107

The specification describes antisense oligonucleotides (X52869-X55271) CC directed against at least 2 mRNAs selected from target genes, coding and connecoding regions of RNAs corresponding to target genes, gene coninitation codons, genomic flanking regions, intron-exon borders, the CC initiation codons, genomic flanking regions, intron-exon borders, the CC regions and all segments of RNAs encoding proteins associated with one CC or more diseases, conditions or mixtures. The antisense oligonucleotides (apecifically X55100-271) can be used for the antisense CC may be derived from sequences X55272-74. These multiple target coligonucleotides (apecifically X55100-271) can be used for the antisense CC treatment of diseases and conditions. Typical diseases and conditions conditions continuing lung diseases, pulmonary vasconstriction, inflammation, CC including lung diseases, pulmonary vasconstriction, inflammation, callergic rhinitis, acute asthma, allergies, asthma, impeded respiration, callergic rhinitis, acute asthma, allergies, asthma, pulmonary cancer your constriction, emphysema, chronic obstructive cultumonary disease (COPD), and cancers such as leukemias, pulmonary cancer, hepatocellular carcinoma, kidney cancer, melanoma, hepatic cunetastases, as well as all types of cancers, melanoma, hepatic cancer, metastasize to the lungs, including breast and prostate cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Query Match

These multiple target coligonucleotides (specifically X55180-271) can be used for the antisense cligonucleotides (specifically X55180-271) can be used for the antisense cr reatment of diseases and conditions. Typical diseases and conditions care those associated with impaired respiration and inflammation, cc ancer those associated with impaired respiration and inflammation, cc allergic rhinitis, acute asthma, allergies, asthma, impeded respiration, respiratory diseases, pulmonary vasoconstriction, inflammation, callergic rhinitis, acute asthma, cystic fibrosis, pulmonary compartatory diseases (COPD), and cancers such as leukemias, lymphomas, cc carcinomas eg. colon cancer, breast cancer, lung cancer, hepatic cancer, hepatocellular carcinoma, kidney cancer, melanoma, hepatic concerts, hepatocellular carcinoma, kidney cancer, melanoma, hepatic concerts, as well as all types of cancers which may metastasize or have concerts as a concert cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Query Match

                                                                         interaction between the agent and the NAM or the expression product as determination of the disorder. The products and methods can be used in the diagnosis, monitoring, research, or treatment of conditions characterised by the expression of various cancer associated antigens. The invention provides nucleic acid sequences and encoded polypeptides which are cancer associated antigen precursors expressed in human brea cancer, renal cancer, colon cancer, gastric cancer, prostate cancer an
                                                                                                                                                                                  The invention relates to a method for diagnosing a disorder characterised by expression of a human cancer associated antigen precursor coded for by a nucleic acid molecule (NAM). The method comprises: (a) contacting a biological sample isolated from a subject with an agent that specifically
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Cancer

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      밁
                                                               This sequence represents a gene encoding a subunit of the cellulose synthase complex of Vigna angularis. The invention relates to subunits cellulose synthetic equipment, that can be used to increase the amount cellulose synthesised by a plant. The proteins and genes encoding them called be used to improve the properties of the cellulose being
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      1598

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present sequence is a DNA encoding Epstein Barr Virus Nuclear Antigen 1 (EBNA 1), which is obtained from commercially available plasmid pCMVEBNA. EBNA 1 protein is used to stably maintain episomes containing EBV origin of replication (orip) and a gene encoding protein or RNA of interest. Eucaryotic host cells expressing EBNA 1 protein are transfected with these episomes to produce recombinant cell lines expressing multiple genes of interest. This provides a rapid and reliable method of stably expressing multiple genes in transfected cells. The episomes are useful in the transfection of genes encoding receptors, transporter proteins, ion channels, adhesion molecules and transcription factors. The episomes carrying desired genes can also be used to transfect cells in gene therapy, antisense therapy, for gene amplification, cell immortalisation, etc.

                                                                                            Q
                                                                                                                                                                                                          This sequence is a fragment of the Kaposi's sarcoma-associated Cherpesvirus (KSHV) LUR (long unique region). This fragment contains coding regions for K1, ORF4 which encodes the complement binding protein v-CBP, ORF6 which encodes a ssDNA binding protein (SSBP), ORF7 which encodes a transport protein, ORF8 which encodes glycoprotein B, ORF9 which encodes DNA polymerase (pol), ORF10, OFR11, K2 which encodes viral interleukin-6 (VIL-6), ORF10 which encodes dihydrofolate reductase (DHFR), K3 which encodes BHV4-IE1 I, ORF70 which encodes Thymidylate synthase, K4 which encodes wMIP-II, K5 which encodes BHV4-IE1 II, K6 which encodes wMIP-II, K7, ORF16 which encodes BHV4-IE1 II, K6 capital protein I, ORF18 and ORF19 which encodes Tegument protein I.

CK (SHV is a new human Herpesvirus (HHV8) believed to cause Kaposi's sarcoma (KS) which is the most common form of neoplasm occurring in persons with acquired immune deficiency syndrome (AIDS). The DHFR protein is useful for vaccination, prophylaxis, diagnosis and treatment of a subject with Kaposi's sarcoma in a call

CC This sequence represents the long unique region and terminal repeat of CC the Kaposi's sarcoma-associated herpes virus (KSHY). KSHY is also known CC as human herpes virus 8 (HHV8). This sequence contains the DNAs of the CI invention which encode KSHY polypeptides selected from: (a) viral CC (a) viral IRF 1; (d) complement-binding protein; glycoproteins B, M or L; (d) capsid protein IV encoded by ORF65; and (e) immediate early protein CC encoded by ORF73. Labelled probes for the nucleic acid, proteins encoded by it, and antibodies (Ab) specific for the proteins are useful for CC detecting HHV8, specifically for diagnosis of Kaposi's sarcoma, in body CC fluids or tissue samples. HHV8 infections can be treated with antisense CC or triplex forming molecules or agents that bind specifically to the protein. Ab may be used for prophylaxis or treatment of HHV8 infection, CC while the protein can be used in protective vaccines. Ab may also be used to differentiate between lymphomas, and HHV8 may be implicated in many CC other lymphoproliferative diseases such as lymphomas, leukaemia, splenomegaly and mycosis fungoides. Cells and animals containing the CC nucleic acid are useful for drug screening. HHV8-derived peptides can be used as targets for antiviral drugs, e.g. dihydrofolate reductase gene CC can be inhibited with methotrexate. These can also be used to determine the immune status of a patient infected with HIV. HHV8 derived protein cc. g. treating rhemacs an anti-inflammatory agent for, craft of the protein and secure is stated as containing containing the secure of the immune status of a patient infected with HIV. HHV8 derived protein cc. g. treating rhemacs

```
CC This is a nucleotide sequence of the stabilising sequence-encoding CC insert. The invention provides a method for increasing the resistance of a core protein to proteolytic degradation that comprises linking or inserting onto or into the core protein a stabilising polypeptide of CC formula [(Glya)X(Glyb)Y(Glyc)2]n where Glya, Glyb, Glyc are 1-6 CC sequential Gly residues and X, Y, Z are Ala, Ser, Val, Ile, Leu, Met, CC Phe, Pro or Thr and n can be anything between 1-66. X, Y and Z need not CC encoding the stabilising polypeptide can be linked onto or inserted into CC a nucleic acid encoding a core protein. The fusion proteins of the CC invention are more resistant to degradation by protease and, thus, have CC alonger half-life than the unfused core protein. The products can be CC used for treating autoimmune diseases, cancer and inflammation. In CC particular, the core protein may be an IkappaB regulator protein for the CC treatment of inflammatory bowel disease, or a nitroreductase protein CC which can activate nitro drugs in enzyme/prodrug therapy to treat cancer CC or other pathological conditions. The fusion proteins can also be used in CC diagnostic methods such as in vivo imaging.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Fig

EBNA 1 protein is used to stably maintain episomes containing EBV origin of replication (orig) and a gene encoding protein or RNA of interest. Eucaryotic host cells expressing EBNA 1 protein are transfected with these episomes to produce recombinant cell lines expressing multiple genes of interest. This provides a rapid and reliable method of stably expressing multiple genes in transfected cells. The episomes are useful in the transfection of genes encoding receptors, transporter proteins, ion channels, adhesion molecules and transcription factors. The episomes carrying desired genes can also be used to transfect cells in gene therapy, antisense therapy, for gene amplification, cell immortalisation, etc.

                                                                                                                                         Production agents and inhibition
                   This invention describes a novel method for generating an antisense library targeted to a selected RNA transcript. The methods can be used for identifying antisense agents and for identifying target sites for antisense-mediated inhibition of a selected gene. The use of a direct library for target site selection significantly simplifies the screening process, since only very small libraries need be prepared and assayed. This sequence represents the vector pShuttle which is used in the method of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 pCMVKmITR-EPI, which contains an Epstern region for EBV nuclea of replication from plasmid pCEP4, a coding region for EBV nuclea antigen A from pCEP4, a pair of inverted terminal repeats from adeno-associated virus, a cytomegalovirus enhancer/promoter, a bovine growth hormone polyA sequence, and a kanamycin resistance selectable marker. Polynucleotides encoding polypeptides, such a selectable marker. Polynucleotides encoding polypeptides, such a erythropoietin or leptin, and ribozymes and antisense polynucleotides can be inserted into the vector. The vector is polynucleotides can be inserted into the vector in the provided that the polynucleotides can be inserted into the vector.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 polynucleotides can be inserted into the vector. The vector is preferred for use in novel compositions and methods for improved polynucleotide delivery into cells. In these methods, polycationic agents are used to increase the frequency of uptake of a nucleic acid (see also V21684-86) into a cell. The polycationic agent can condense with the nucleic acid and inhibit serum and/or nuclease degradation of the nucleic acid. The nucleic acid can be a vector, may express a therapeutic protein or a vaccinating viral or cancer antigen, or is itself therapeutic (antisense or ribozyme). The methods and compositions can be used in the gene therapy of many diseases.
